

General Data Protection Regulation Services

The European Union's (EU) General Data Protection Regulation (GDPR) will come into full effect May 2018. The Regulation requires organizations to not only be able to track the collection, use, transmission and removal of EU citizen data but also disclose breaches almost immediately upon detection. The main provisions also include the implementation of reasonable measures to protect personal information against loss or exposure.

Sayers provides organizations services to assess their overall GDPR readiness. Sayers will evaluate, build, implement and maintain processes and technologies to help meet regulatory requirements. Many of the services we offer also help organizations address the needs of other data privacy regulations around the globe.

GDPR SERVICES

- ✓ Readiness Assessment
- ✓ Data Protection Services
- ✓ Data Protection Impact Assessment Assistance
- ✓ ISO Certification Assistance
- ✓ Global Data Privacy Assessment

GDPR Readiness Assessment

A Readiness Assessment will identify how closely your data and IT security aligns with the regulation through the identification of any potential gaps in your existing environment.

Beginning with a series of interviews, our consultants work with you to understand and map personal data flows created within your organization's business process. We review existing data protection programs and identify GDPR compliance gaps. We consider the regulation's functional requirements and examine how those translate into technical requirements you may need to address.

"At the close of each engagement, clients will receive detailed support materials such as system design documentation, architecture diagrams, scorecards and checklists depending on the service provided."

Data Protection Services

Visibility into an organization's data usage and storage is a necessity for GDPR compliance, particularly when it comes to tracking personally identifiable information and an EU citizen's right to be forgotten. An organization must know where all of a citizen's information is stored and have the ability to confirm its deletion. Technologies that may help with GDPR compliance include Data Loss Prevention (DLP), Data Classification, Cloud Access Security Brokers (CASBs) and encryption technology.

DLP can locate information and ensure, if needed, its removal through Data At Rest (DAR) scans and reports. DLP can provide even greater granularity in tracking data.

CASB technologies assist organizations with monitoring and access to data traversing or data stored in the cloud while data encryption is available to render intentionally or accidentally leaked information unusable.

Data Protection Impact Assessment Assistance

Impact assessments must occur as processes and technologies are modified or added to an organization's environment. Assessment assistance services inform how changes within your environment will affect data processing operations and the protection of personal data. The result is formal documentation outlining the strengths and deficiencies of current operations and security controls. We will also prioritize the protection of personal data.

ISO 27001 Certification Assistance

ISO certification not only validates your organization's commitment to protecting customer and partner information but also helps your employees become more engaged with your security program. Obtaining ISO certification will support your GDPR positioning by implementing an Information Security Management System (ISMS).

Global Data Privacy Assessments

GDPR is designed to consolidate the various data protection standards within the EU, but organizations that store or transmit data on an international scale face additional regulations regarding customer data and employee privacy. Establishing an awareness of, and appropriately managing, these regulations is crucial to designing and implementing a security strategy that protects your organization's assets while conforming to regulatory standards.

Our Global Data Privacy Assessments provide a clear, concise and comprehensive review of your exposure to regulations in countries in which you operate or store and transmit data. For example, workplace monitoring may be allowed in some countries but not in others. Security programs must be able to address these differences.
