

Network Visibility and Risk Assessment

How we can help:

The Sayers Visibility and Risk Assessment is a non-intrusive offering that will allow your organization to quickly and accurately gain visibility into areas where your legacy technology cannot. To perform our analysis, we deploy a non-intrusive appliance(s) within the network to monitor the application traffic traversing the Internet gateway. At the end of the data collection period, a comprehensive report is created. This deliverable provides an analysis of application traffic, overall security risk and related business risk. The report closes with a detailed look at how effective an organization's existing technologies are at supporting and enforcing its computing policy.

What you will receive:

- ✔ Granular visibility into application (including SAAS) usage
- ✔ High-risk application consumption
- ✔ Vulnerability exploit attempts
- ✔ Known and unknown malware discovery
- ✔ Visibility into viruses, spyware, botnets, APTs and more
- ✔ File Transfer Analysis
- ✔ Total threats circumventing current technologies
- ✔ High-risk URL traffic usage
- ✔ Loss of confidential data through unmonitored and/or unauthorized file transfer
